SUMMARY

Backend-focused Software Engineer building production order, returns and observability services in Node.js/TypeScript, with prior Java Spring Boot microservices experience in healthcare.

TECHNICAL SKILLS

Languages: Java, TypeScript, JavaScript, Python, SQL
Backend & Frameworks: Node.js, Express.js, NestJS, Spring Boot, REST APIs, gRPC, Microservices, React
Databases: MySQL, PostgreSQL, MongoDB, Redis, Supabase
Messaging & Architecture: AWS SQS (FIFO), Apache Kafka, Event-Driven Architecture, Distributed Systems, Idempotency
Cloud & DevOps: AWS (EC2, S3, SQS), Docker, GitHub Actions, ArgoCD, CI/CD, Git, Sentry, ELK
Testing: Jest, Puppeteer, unit, integration and end-to-end testing
Core CS: Data Structures & Algorithms (1000+ problems on LeetCode & Codeforces), OOP, System Design

WORK EXPERIENCE

OZi | Backend Developer *May 2026 – Present*

- Built multiple production REST APIs for a Node.js/TypeScript order service powering order placement, live tracking, returns and admin operations for a quick-commerce platform.
- Built AWS SQS FIFO workflows for inventory, logistics, wallet settlement and notifications, plus claim-based redrive that prevented duplicate wallet deductions.
- Built an observability platform with error grouping, latency percentiles, SLOs, error budgets, Slack alerts and a unified order timeline across 26 data sources.
- Designed return and exchange pickup capacity management end to end, including the MySQL schema, IST-aware engine, CX overrides and admin UI; verified with 180+ tests.
- Shipped failed-return rescheduling with eligibility checks, WhatsApp notifications, deep-link CTAs and quiet-hours-aware reminders.

Bajaj Finserv Health | Software Engineer Intern – Backend | Certificate *July 2025 – October 2025*

- Engineered Spring Boot microservices for the Universal Provider Portal (UPP), supporting hospital-payer integrations across 50+ partner hospitals and 100K+ daily transactions at 99.9% uptime.
- Improved backend throughput to 300+ requests/second under concurrent load, a 3–4× improvement over the legacy implementation.
- Centralized logging and monitoring on the ELK Stack with structured logs and real-time Kibana dashboards, reducing mean time to resolution (MTTR) for production incidents by 40%.
- Optimized critical API response times by 30–35% by pairing PostgreSQL with a Redis caching layer for hot data.
- Automated ArgoCD-driven CI/CD deployments, halving manual deployment effort and enabling zero-downtime releases.

PROJECTS

Ekayu – Personal Health & Life Record | Website *August 2026 – Present*

- Built solo a private health and life-record app as a 7-package TypeScript monorepo with PostgreSQL and Supabase, spanning 115 pages and 103 tables with strict CI checks.
- Designed an append-only data model where edits add corrections instead of overwriting, keeping any past state queryable.
- Built offline sync from scratch with a device-side queue, logical clocks to order cross-device edits, and idempotency keys so retries never log the same dose or workout twice.
- Made the database closed by default with row-level security forced and zero policies, so the public API key reaches nothing, verified by a dedicated test suite.

Proximity-Based Personalized Ad Delivery System (IoT) | GitHub *October 2024 – February 2025*

- Built an IoT proximity-advertising system (Raspberry Pi BLE nodes, Express.js, MongoDB, Gemini API) detecting 20+ devices per node in <100 ms and serving personalized, AI-generated ads within a 5–10 m range for 35–40% higher engagement.

EDUCATION

The LNM Institute of Information Technology *October 2022 – May 2026*
B.Tech. – Computer Science and Engineering | CGPA: 7.64 / 10

LEADERSHIP AND ACTIVITIES

Coordinator: Table Tennis Club | Executive Member: Training & Placement Cell | Member: Entrepreneurship Club
